

FilterAlg Status

- 13 of 16 vetoes are programmed
 - Skirt veto needs to be done (easy if coordinates of cal are known)
 - 2 cal related vetoes not done, because they are not currently used. Should be simple to write these if desired.
- Found 2 significant logic problems in OnboardFilter
 - JJ already fixed one, and is working on the other
 - Will reevaluate OnboardFilter performance when fixes are made
- Currently: the track-tile matching vetoes (there are 5 of these!) are buggy, but expect to have them working by the end of the week.
- Will write detailed documentation on FilterAlg, and leave 3 remaining vetoes for others to finish - must move on to other things!
