

Gamma-Ray Burst Spectral Analysis with the SAE

Prepared by Yasushi Ikebe – GSSC

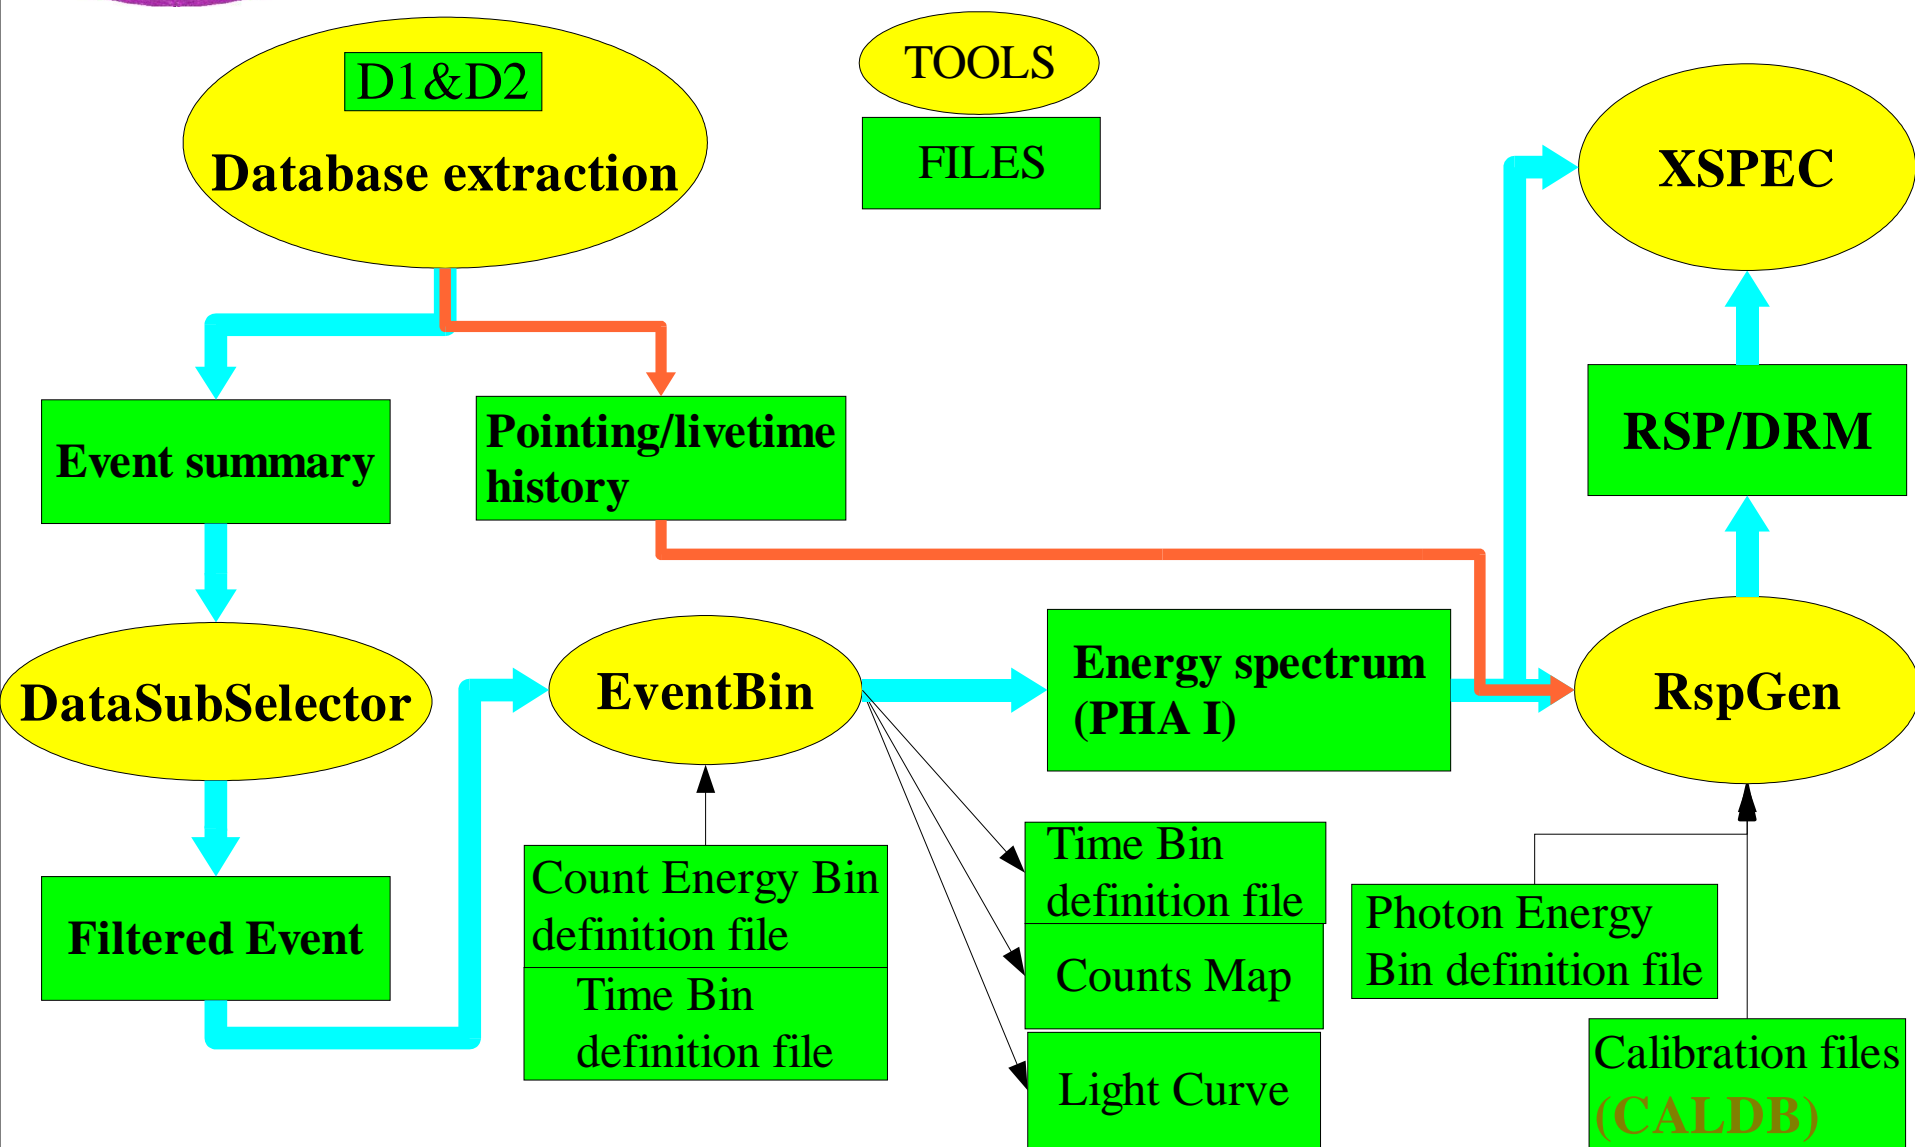

Presented by Dirk Petry – GSSC

Assistance from David Band – GSSC

- In this presentation we show how the existing SAE tools can be used for binned gamma-ray burst spectral analysis.
- We assume that the user knows the location and time of the burst.
- Thus, the analysis we demonstrate starts with:
 - Start and stop time**
 - RA and DEC of the burst**
- And ends with:
 - A spectral fit to the burst**
- An expanded tutorial can be found on the website http://glast.gsfc.nasa.gov/ssc/dev/binned_analysis/GRB_spectra_DC1.html

- The SAE will not include any formal burst detection tools
- Your alternatives:
 - Use EventBin (event binning tool) to create a lightcurve and a sky count map, and locate the event.
 - The SAE currently does not have a dedicated tool for display. Use fv or fplot in FTOOLS, and/or DS9
 - Use DS9 to read event fits file, bin the data, and display it
 - Write your own tools
 - The on-line tutorial tells you how to pull FT1 into IDL
- After launch
 - The GBM will detect and localize bursts, and provide lightcurves and other burst information
 - The LAT will have detection software onboard and on the ground (details TBD)

Schematic Outline of Analysis Flow

- Use the U1 website to extract the necessary photon and livetime/pointing data (see talk by Tom Stephens), which have to be extracted from a circular region centered on the object.
- Necessary input:
 - Burst position (RA, DEC)
 - Extraction radius
 - Start and stop time
- FTP resulting data files to your analysis directory
- With DataSubSelector, apply the standard cuts (background, PSF, and energy resolution).
Do not perform any additional selections, since RspGen (response matrix calculator) cannot handle complicated data screening criteria

- Use EventBin to bin the photons into a series of binned spectra. EventBin is part of SAE.
- Energy binning-user selected; a default is provided
- Time binning-choices:
 - User selected
 - Time bins of equal duration
 - Time bins with S/N in a given energy range greater than threshold
 - Bayesian Blocks binning (currently does not work)
- Input:
 - FT1 file with photons
 - FITS file with energy binning (default of '1024 channels in 30MeV-30GeV, equally spacing in log scale' is provided)
 - FITS file with time grid, if necessary
- Output:
 - One or a series of FITS files in PHA-I format

>test_EventBin.exe

Name of the Event Data File: [D1.fits] : **U1WEB1121....53_D1_results.fits**

Name of the output file: [**spec.fits**] :

Binning method (LC, PHA1, PHA2, SPEC): [**PHA1**] :

Name of the energy Bin File: [**ChanEnergyBin.fits**] : <-default provided

Algorithm for time bins calculation: (BAYESIAN, CONSTSNR, UNIFORM, USERBINS, NONE) [**NONE**] : <- one time bin

Start Time: [100] : **1000**

Stop Time: [800000] : **2000**

You'll find spec.fits

Algorithm for time bins calculation: (BAYESIAN, CONSTSNR, UNIFORM, USERBINS, NONE) [**NONE**] : **UNIFORM**

Name of the time bin file: [**UniformTimeBin.fits**] :

Start Time: [1] : **1000**

Stop Time: [8.863475625000000E+05] : **2000**

Delta Time: [100000] : **100**

You'll find spec1.fits, spec2.fits, ,,,, spec10.fits, and UniformTimeBin.fits

EventBin creates Counts Map,
displayed with ds9 here

- The count spectra in the PHA files are functions only of measured count energy. The spectral models that will be fit are fluxes as a function of energy.
- Use RspGen to collapse the LAT response (many photon parameters \Rightarrow many count observables) into RSP matrix (photon energy \Rightarrow count energy). RspGen is part of SAE.
- RspGen calculates a response at the center of the time bin, i.e. change of the satellite attitude is not taken into account
- Input:
 - **Spectrum FITS file in PHA-I format**
 - **FITS file with energy binning for spectral model (default of '1024 channels in 30MeV-30GeV, equally spacing in log scale' is provided)**
- Output:
 - **Response Matrix FITS file in the RMF format**

<input type="checkbox"/> 1	MATRIX	Binary	6 cols X 1024 rows	Header Plot Table
<input type="checkbox"/> 2	EBOUNDS	Binary	3 cols X 1024 rows	Header Plot Table

- Use XSPEC to fit spectra
- XSPEC is part of XANADU, HEASARC suite of advanced analysis tools. XSPEC must be downloaded and installed separately from the SAE. See

<http://heasarc.gsfc.nasa.gov/docs/xanadu/xanadu.html>

- XSPEC currently is supported only on UNIX platforms; it may eventually run on Windows.
- XSPEC includes a rich set of spectral models. Relevant models for GLAST are:
 - *pegpwlw*: Pegged power law with adjustable pivot energy
 - *grbm*: 4 parameter GRB model. Typically used in GBM energy band, but may be useful for Compton component.
- Eventually scripts will be provided to automate fitting of series of spectra
