Gaudi Algorithm Structure for TkrRecon?

As a working exemple:

```
GAUDI
  |________________|
  |                |
  v                v
BroadVtxFinder    ConcreteVertexer
  |                        |    Pass initial estimate
  v                        v
BigShotVertexer        GamConvVertexer
  |                        |    Failed?
  v                        v
Failed?
  |                        |    Failed?
  v                        v
SingleTrackPrescription
```

GAUDI (internally or via jobOptions) would control:

- The Sequence of procedures to be called;
- The Decisions to make at each step
  (out of a list of possible options);
