GAUDI Event Model for GLAST

GAUDI Model

There are two analyses and/or administrative functions that are executed when the job runs (specified in the job options file).

The event selector service is capable of selecting a subset of events based upon user specific criteria (if any).
**How IRF File is Read**

- Each IRF file is a general listing of event data records.
- Each event record is itself a database of the response for each detector in the instrument, keyed by the CLAST detector ID.

The Response class reads data for a particular detector element (to be identified with its CLAST detector ID) into that detector element within a hierarchy.
