NCR 458

- **Anomaly Description**
 - TEM reported TKR GTCC and GTRC phasing errors during a single test in two tower test configuration.
 - Reopened when TEM reported TKR GTCC and GTRC phasing errors during six tests in full LAT configuration at an apparent higher rate than expected
- **Root Cause**
 - Appears to result from a known bug in the VHDL for GTIU FPGA.
 - Bug causes the FPGA to issue a TKR readout token for event “N+1” instead of “N” under known, rare conditions.
- **Resolution**
 - Recent test data in fact shows no significant change from previous tests
 - Will study potential for impacts in orbit

NCR 684

- **Anomaly Description**
 - Tracker modules have occasional out-of-spec noise occupancy in isolated layers (“noise flares”).
- **Investigation**
 - Analysis showed similar noise at INFN.
 - Occupancy still within spec.
 - Noise flares have been observed from 4 layers (out of 576 layers) during 21 hours of 16-tower muon data monitoring. Two of the layers are in flare states for 10-20% of time while the others are in flare states for 1-2% of time.
 - TKR meets data occupancy and trigger occupancy requirements even during flares.
 - No noise flares have been observed in review of 100 hours of online Tracker FM 8 data taking, a more detailed review of offline data is in process.
- **Resolution Plan**
 - Continue extended testing on Tracker module 8 to further characterize.
